Wood-burning fire pits must be lined with a proper metal insert or refractory (fire-rated) brick to protect the concrete components from extreme exposure to heat. Extreme heat on a concrete surface may affect the structural integrity of the concrete and can be dangerous. The floor of the fire pit should always be constructed using refractory brick or a sand bed. For your safety, always use a spark screen over the fire.

## Sealer Best Practices

---

- The paver surface should be **clean** and free from oil, dirt, dust and any loose material. This ensures a uniform result and allows the sealer to better penetrate the surface.
- The pavers should be **free of any visible efflorescence**.
- If pavers have been sealed before, make sure to resealed with compatible product.
- **Surface must be dry** (48 hours without precipitation) and warm to the touch (morning).
- Joint sand must also be dry.
- Make sure lawn sprinklers are shut off.
- Best air temperature is between **50 degrees to 80 degrees** with no rain forecasted for the next 24 hours.
- It is best to apply product under constant weather conditions and use the **same application method from start to finish**.
- The paver joints should be completely filled with dry correctly-graded joint sand. The top level should not exceed the bottom of the chamfer or **1/8" below** the surface on the non-beveled or tumbled paver surface.
- **Always test the product** on a small hidden area to ensure the results will meet your expectations.
- Always show homeowners samples to ensure expectations.

**At this point read all sealer instructions and determine the best sealer for your desired goal. Do you want to retain the original look, enhance the color, or stabilize the sand joint?**

- **Read application information as each sealer can be applied differently.**
- **Make sure you have the correct equipment based on type of sealer. Solvent based sealers need solvent resistant sprayers, watering cans or paint trays.** Water base sealers can be generally applied using plastic equipment. Example: solvent based sealers come in metal containers and water based sealers come in plastic containers.
- Care should be taken that no excess sealer material is pooled on the surface during application always back roll. When using solvent based sealers make sure roller is solvent resistant or for all paints. Foam rollers work best and are less likely to pull sand from the joints.
- Stabilizing sealers are generally sprayed or flood coated with a watering can, then back rolled.
- Acrylic non-stabilizing sealers can be sprayed, then back rolled or rolled on using a metal paint tray.
- **Send your most experienced worker to do sealing projects.**

---

## Polysand Best Practices

---

- Ensure that paver surface has **proper drainage runoff** (Min 1" over 8'). Finished paver height should always be higher than grade to allow proper surface drainage.
- **Do not set pavers in limestone screenings.** This product holds moisture and does not meet the gradation, drainage qualities or strength of coarse concrete sand.
- Make sure pavers are **clean of all construction dust**. Residual construction dust will haze pavers!
- **Compact pavers** into setting bed to create proper interlock.
- Read and review all polysand manufacturers methods of application. **(Read Directions)**
- **Don't rush polysand installation.**
- Paver area must be completely dry.
- Lay bags of polysand over paver area. **Stage bags** in areas of coverage. Example: one bag for 60 square feet.
- **Do not over sweep sand.** Sweep sand back and forth within coverage area to fill paver joints.
- Compact sand into joints. This is a must in achieving proper density of the sand joint (repeat 3 times). Compaction is critical to assuring sand strength.
- Do not fill sand above the chamfer of paver. Sand should sit 1/8" below bottom of chamfer.
- Use a fine-bristle broom to **remove any excess sand from the paver surface**.
- Use a **leaf blower** remove any sand or binder residue.
- **Review all watering directions (each manufacturer has different watering instructions.) This is VERY IMPORTANT!**
- Always start watering at the **bottom of the slope**.
- Always start watering in **controlled areas** per manufacturers recommendations. Example: complete watering in 200 sq. ft. area then move on to the next 200 sq. ft. and repeat.
- During final watering of poly sand, **clean surface by removing excess water** with leaf blower or squeegee depending on paver surface texture. This will remove any leftover binder residue or sand.
- Final thoughts – Always be aware of the weather when installing poly sand. **(Temperature and setting time ratings differ between products.)**
- Refer to all manufacturers websites for installation videos.

# IMPORTANT NOTES

## UNILOCK PAVER PATTERNS

This Product Data Guide contains an extensive reference to patterns and designs. The purpose of these pattern swatches is to help the designer plan unique and exceptional designs. The percentages of products shown are based on the pattern and not on bundle configurations. In fact, there may be situations in which a pattern has been created with one particular size of stone, but that stone only comes packaged with two other sizes. This means that the designer will have to plan how the other components are used in the overall plan. This is usually accomplished by adding a border or an accent. As a result, overages or shortages may occur in certain patterns. The designer and/or installer of Unilock products accepts all responsibility for design and all associated costs incurred as a result of applying any of Unilock's suggested design patterns in a project. Please plan your project and review your order carefully prior to ordering.
